

# Mathematics and Culture: Geometry and Everything Else

Judith V. Grabiner

Pitzer College, Claremont, California

Oxford, 10 December 2015

**Euclid**  
**(325–265 BC)**

Plato on the left, Aristotle on the right, from Raphael's painting "The School of Athens."

René Descartes: If we start with self-evident truths and then proceed by logically deducing more and more complex truths from these, **“there cannot be any propositions so abstruse that we cannot prove them, or so hidden that we cannot discover them.”**

*Discourse on Method*, 1637.

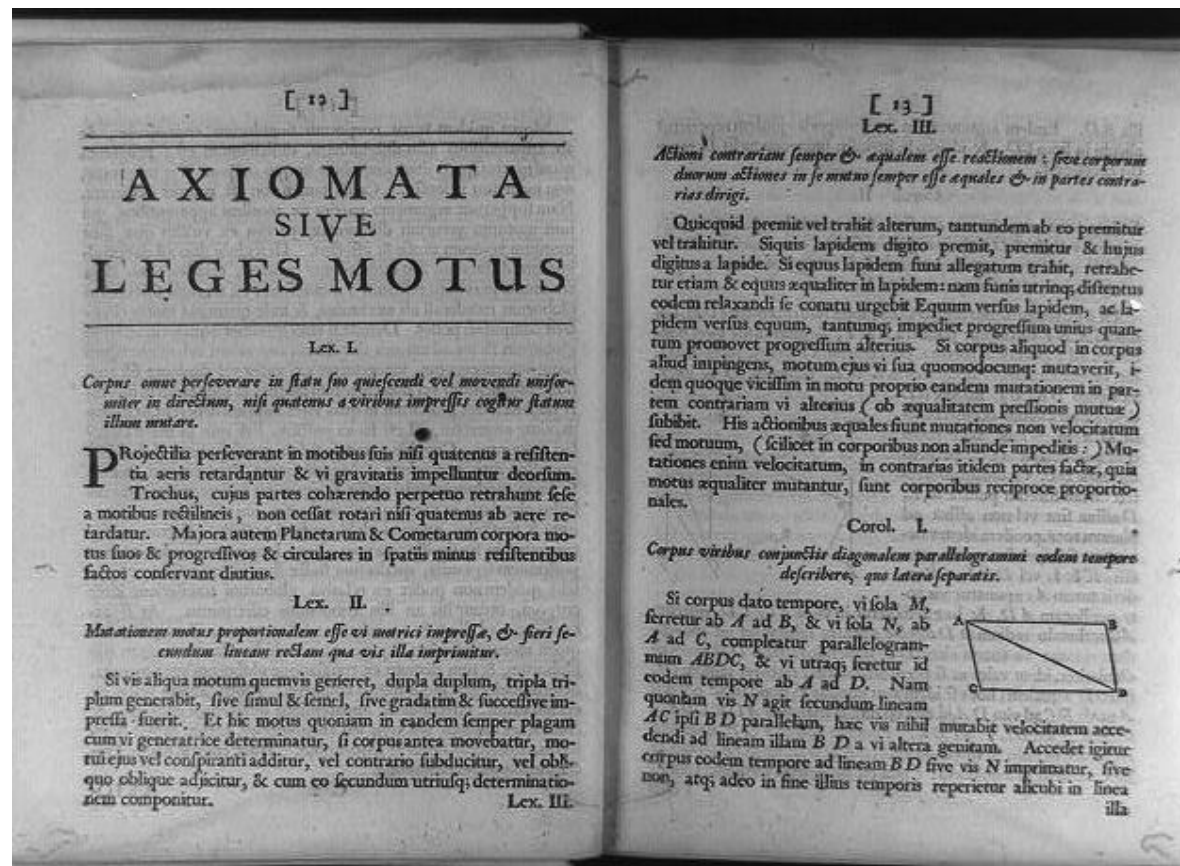

# Benedict Spinoza (1632 – 1677)

# From Newton's *Principia* (1687)

**We hold these truths to be self-evident,**  
that all men are created equal...

**That whenever any Form of Government becomes  
destructive of these ends, it is the Right of the  
People ... to institute new Government...**

The history of the present King of Great Britain ...  
repeated injuries and usurpations, all having in direct  
object the establishment of an absolute Tyranny ...

To **prove** this, let facts be submitted to a candid world.

...

We, ***therefore***, the Representatives of the United  
States of America...solemnly publish and declare, that  
these United Colonies are, and of Right ought to be  
Free and Independent States.

# Euclid's 5 postulates

1. A straight line can be drawn from any point to any other point.
2. A finite straight line can be extended as long as you want.
3. A circle can be constructed with any point as its center and with any length as its radius.
4. All right angles are equal to one another.
5. (The so-called “parallel postulate”)  
If a straight line that falls on two straight lines makes the interior angles on the same side add up to less than two right angles, then the two straight lines, if produced indefinitely, meet on that side.

Euclid's Fifth Postulate says: If angle A plus angle B add to less than 2 right angles, then the **green lines** must meet!

Some medieval Islamic and Jewish mathematicians  
who worked on Euclid's parallel postulate:

**Ibn al-Haytham (965-1039)**

**Omar al-Khayyam (1048-1131)**

**Nasir al-Din al-Tusi (1201-1274)**

**Levi ben Gerson (1288-1344)**

Some European mathematicians of the 17<sup>th</sup> and 18<sup>th</sup> centuries who worked on trying to prove the Fifth Postulate (plus al-Tusi, whose work Wallis & Saccheri knew):

John Wallis, Girolamo Saccheri, Johann Heinrich Lambert, Adrien-Marie Legendre, Joseph-Louis Lagrange

There is only one parallel to the bottom line through the point **P**.

If two parallel lines are cut by a 3d line, the alternate interior, and the corresponding, angles are equal (*Elements*, Book I, Prop. 29)

## The Principle of Sufficient Reason

- For everything that is, there's a reason why happens as it does and not otherwise.

Lever, with equal weights at equal distances from the fulcrum, must balance, says Archimedes. **Why?**

Lever, with equal weights at equal distances from the fulcrum, must balance, says Archimedes. Why?

**Well, why not?** (The principle of sufficient reason!)

# Giordano Bruno (1548 – 1600)

# Gottfried Wilhelm Leibniz (1646 – 1716)

Newton's First Law: Every body perseveres in its state of being **at rest** or of **moving in a straight line at a constant speed**, unless a force acts upon it.

# Joseph-Louis Lagrange (1736-1813)

Europeans honor their scientists on stamps  
(plus you get his dates for free)

Given a line and an outside point P, there is only one line through point P that is parallel to the original line.

(That's the postulate found in most high-school textbooks.

It is logically equivalent to Euclid's Postulate 5)

# Lagrange's diagram (1806)

# From Newton's *Principia*:

*A body acted on by two forces conjoined will describe the diagonal of a parallelogram in the same time that it would describe the sides if acted on by those forces separately.*

*Corpus viribus conjunctis diagonalem parallelogrammi eodem tempore describere, quo latera separatim.*

Si corpus dato tempore, vi sola  $M$ , ferretur ab  $A$  ad  $B$ , & vi sola  $N$ , ab  $A$  ad  $C$ , compleatur parallelogrammum  $ABDC$ , & vi utraq; ferretur id eodem tempore ab  $A$  ad  $D$ . Nam quoniam vis  $N$  agit secundum lineam  $AC$  ipsi  $BD$  parallelam, hæc vis nihil mutabit velocitatem accedendi ad lineam illam  $BD$  a vi altera genitam. Accedet igitur corpus eodem tempore ad lineam  $BD$  siue vis  $N$  imprimatur, siue non, atq; adeo in fine illius temporis reperietur alicubi in linea

# Leonhard Euler (1707 – 1783)

# Immanuel Kant (1724 – 1804)

Given triangle ABC. Let's prove angles  
 **$A+B+C$  = two right angles** (from Euclid's  
*Elements*, Book I, Theorem 32).

Extend the line BC to D, and  
construct CE parallel to AB

Since  $AB$  is parallel to  $EC$ ,

$\angle A = \angle ACE$  (alternate interior angles)

$\angle B = \angle ECD$  (corresponding angles)

$\angle ACB = \angle ACB$  (everyone knows THAT).

Add these equations up!

Right-hand side, the 3 angles around  $C$ , add up to two right angles because they're on a straight line.

*Therefore the 3 angles of the triangle do so as well.*

Extend the line BC to D, and  
construct CE parallel to AB

Since **AB is parallel to EC**, previous theorem implies:

$\angle A = \angle ACE$  (**alternate interior angles equal**)

$\angle B = \angle ECD$  (**corresponding angles equal**)

$\angle ACB = \angle ACB$  (everyone knows THAT).

Add these equations up!

Right-hand side, the 3 angles around C, add up to two right angles because they're on a straight line.

*Therefore the 3 angles of the triangle do so as well.*

# Voltaire (1694 – 1778)

## Masaccio, “The Trinity” (1428)

Giorgio Vasari said in 1550 of this pioneering painting, “It looks as though the wall is pierced.”

Photographs do this for us;  
Renaissance artists needed  
sophisticated geometry.

# The Bayeux Tapestry (11th century)

# Nicholas of Verdun, “The Crossing of the Red Sea” (c. 1181)

Piero della Francesca or Luciano Laurana,  
“The Ideal City,” c. 1470

Euclid, Optics, Proposition VI:  
Parallel lines seen from a distance appear to be  
an unequal distance apart

**“I’ll tell you EXACTLY how far apart.”**

**Euclid, Book VI, Theorem 2:**

**If a straight line is drawn parallel to one of the sides of a triangle, then it cuts the other two sides of the triangle proportionally**

Alberti Construction (after Leon Battista Alberti, 15th century)

Parallel horizontal lines perpendicular to the plane of the picture are drawn to meet at a point  $V$ , the principal vanishing point.

Parallel horizontal lines perpendicular to the plane of the picture are drawn to meet at a point V, the principal vanishing point

Piero della Francesca, “Flagellation of Christ”  
15th century

# Leonardo da Vinci, “The Last Supper” (c. 1498)

# Albrecht Dürer

## How to draw a lute in perspective (1525)

mit einem anderen puncten aber also yst das du die gansen lauten gar an die taffel punctirst. Dann  
 auch all puncten die auf der taffel von der lauten weiden sind mit lauten zusamen so siehst du was dar  
 auß wird, also magst du ander ding auch abzeichnen. Dese methode hab ich hernach außgerissen.

Und damit gütlicher lieber Herr will ich meinen scherz bei end geben / und so mir Got genad ver  
 leycht die bücher so ich von menschlicher proportion vñ anderen dartzu gehörendt gescheben hab mit  
 der zeyt in druck bringen und darvon maniglich gewarnt haben. ob sich vñ and  
 sern wirdt mir diß außgucken büchlein wider nach zu drucken. das ich das  
 selb auch wider drucken will / vñ auß lassen gem mit meren vñ  
 größerem zůfatz dartzu beschreiben ist. darnach mag  
 sich ein rechtlicher richter Got dem Herrn  
 sey lob vñ eer ewiglich.

## **The three independent discoverers of Non-Euclidean Geometry**

Carl Friedrich Gauss (1777 - 1855)

János Bolyai (1802 – 1860)

Nikolai Ivanovich Lobachevsky (1792 – 1856)

Non-Euclidean Surface: The “**shortest distances**” red & yellow never meet the blue, which means both are **parallel to the blue**.

**Yellow and blue are parallel** to one another (never meet) but **are not equally distant** from one another.

Both red and yellow, although **parallel to the same blue line**, nevertheless **pass through the same point**.

# **Georg Bernhard Riemann**

## **(1826 – 1866)**

He brought non-Euclidean geometry into the mainstream of mathematics through his theory of more generalized spaces, which he called “manifolds.”

Hermann von Helmholtz, 1821 – 1894

# M. C. Escher, “Hand with Reflecting Sphere”

“What Copernicus was to Ptolemy, so  
Lobachevsky was to Euclid.”

-- W. K. Clifford (1845 – 1879)

# Henri Poincaré, 1854 –1912

# Einstein, general relativity, curved space

**General Relativity:** Light travels along the curved space taking the shortest path between two points. Therefore, light is deflected toward a massive object! The stronger the local gravity is, the greater the light path is bent.

## Corner of a room

José Ortega y Gasset (1883 – 1955):

Euclidean geometry is **an unwarranted extrapolation of what was locally observed** to the whole universe. Einstein's relativity, which requires new geometries of space-time, promotes the **harmonious multiplicity of all possible points of view**.

# Zaha Hadid, “The Ideal House” (2007)

Buildings designed by Zaha Hadid
